

CLEANING COMPOSITIONS FOR REMOVING ORGANIC DEPOSITS IN
HARD TO REACH SURFACES

Related U.S. Applications

[0001] This application is a continuation-in-part of Serial No. 09/372,198, filed August 11, 1999, entitled "SMOKER'S PIPE CLEANER AND METHOD OF USE," allowed April 12, 2001, and issued as U.S. Patent No. 6,284,056 on September 04, 2001, which discloses and claims subject matter disclosed in provisional application Serial Number 60/096,091, filed August 11, 1998. The entire disclosure of the previous applications are incorporated herein by reference

BACKGROUND OF THE INVENTION

Field of the Invention

[0002] The present invention concerns an abrasive-containing liquid cleaning composition for removing organic deposits from hard to reach surfaces and a method of use thereof. More specifically, the invention concerns to an easy to rinse cleaning composition that cleans and disinfects at the same time.

Description of the Related Art

[0003] The use of cleaning compositions to remove organic deposits is well known in the prior art. Effective removal of organic deposits is a considerable problem, which in the past has required the use of highly corrosive, unsafe cleaners, typically based on highly alkaline caustics such as sodium or potassium hydroxide, sometimes accompanied by laborious scrubbing and/or scraping.

[0004] Further, caustic cleaners require substantially elevated temperatures to work effectively and are extremely difficult to remove by rinsing. Many caustic cleaners, such as those incorporating sodium hydroxide, damage the skin of the user and produce hazardous fumes. Such caustic cleaners can also scar, damage and even destroy many types of surfaces. The use of these products also raises serious hazards to the skin and eyes of the

user.

[0005] Another problem presented by the use of these products is that the chemicals fill the air of the building in which they were used causing eye, nasal, and lung irritation. After the cleaning solution dries, then the residual chemical and mineral precipitates (solids) flake off and become airborne, and further irritate eyes, nose, lungs, and skin. The aforesaid residual chemicals and mineral precipitates may trigger allergies, asthma attacks, and other sinus and respiratory problems.

[0006] To avoid the problems associated with caustic cleaners, non-caustic cleaners, which are typically not as effective as caustic cleaners, are employed in many applications. Because of the reduced effectiveness of the non-caustic cleaners, additional time and labor is required to remove organic deposits. Non-caustic cleaners are sometimes initially used to remove a portion of the organic deposits with the remainder being removed by caustic cleaners. In this manner, the use of caustic cleaners is reduced as much as possible.

[0007] Another problem encountered with the prior art is that while organic deposits are generally easy to remove from relatively flat surfaces, it is very difficult to remove the organic deposits from cracks, crevices, corners, passages, and other hard-to-reach places.

[0008] In view of the difficulty of the cleaning compositions discussed above to access or adequately clean hard to reach surfaces of a substrate, there has been a recent trend to employ liquid cleanser that breaks down and removes residue or scale in the hard to reach surfaces.

[0009] A problem presented with these liquid compositions is that they merely provide a pre-soaking treatment and require brushing to remove deposits. Thus, areas not reached by a brush are not cleaned. This problem becomes acute in the case of convoluted or sharp angled corners, passages, or other pieces.

with various household detergent products, such as glass cleaners, tile cleaners, carpet cleaners, etc. He quickly realized that most of these products could be eliminated from consideration due to the unpleasant and possibly toxic residues left behind after cleaning.

[00015] Accordingly, the present inventor felt a need for a non-hazardous cleaning composition for removing organic deposits that is safe to use and will not damage the surfaces to be cleaned. Particularly, he felt that there is a need to provide a cleaning composition that will not damage the skin of the user.

[00016] Also, there is a need for a non-toxic cleaning composition that does not leave a visible residue.

[00017] Further, there is a need for a non-toxic product, which can be used for users having allergy problems.

[00018] Further, it can be appreciated that there exists a need for a cleansing composition for cleaning and disinfecting hard to reach surface of a substrate that is capable of removing organic deposit on the hard to reach surface quickly and in a single cleaning cycle.

[00019] Finally, there remains a need in the art for cleaning compositions which include an abrasive that exhibits improved performance, is less expensive, easy to handle, easy to disperse in the substrate and would not leave residue in the hard to reach surface or the substrate.

SUMMARY OF THE INVENTION

[00020] It is therefore an object of the present invention to provide a cleaning composition that represents a vast improvement over the above-discussed cleaning compositions.

[00021] It is yet another object of the invention to provide cleaning compositions, which effectively remove organic deposits on hard to reach surfaces without having a detrimental effect on the substrate.

[00022] It is yet another object of the present invention to provide a cleaning composition which achieves cleaning and disinfecting in

a much shorter time, without scrubbing, as compared to conventional cleaning compositions.

[00023] It is yet another object of the present invention to provide a cleaning composition that does not leave a visible residue.

[00024] It is yet another object of the present invention to provide a cleaning composition that can be used by users having allergy problems or customer that prefer natural product.

[00025] The present inventor surprisingly found that a stable, easy to rinse cleaning composition that overcomes or minimizes the drawbacks of the prior art, could be prepared by combining a water miscible solvent, such as alcohol, a salt in solid form and water.

[00026] It is essential to the present invention that the salt is present from about 30% to about 70% by weight of the composition at 20°C. in the form of a solid phase comprising crystals of the salt. The composition will therefore comprise a salt in saturated aqueous solution of the salt, together with the crystal form.

[00027] The salt must have high solubility in water, and a low solubility in alcohol in order to provide the abrasion effect and be easily rinseable with water.

[00028] Due to the high solubility of salt in water (and poor solubility in alcohol), as the proportion of alcohol is increased, the lower the amount of salt needed to ensure presence of crystalline salt in the final composition. As the proportion of water is increased (and the proportion of alcohol is correspondingly decreased), the proportion of salt must also be increased in order to ensure the presence of inorganic salt in crystalline form in the final composition.

[00029] The inventor found to be an advantageous property of the composition of the present invention that the salt, which serves as a mechanical abrasive, does not clog the interior surfaces of the substrate; this being due to the water solubility of the salt resulting in the complete removal of any residual salt during the final step of rinsing the substrate after cleaning. Any other solid abrasives, in comparison, would stick to the organic deposits

in the interior surfaces of the substrate and clog even zigzagged internal passages.

[00030] The solid salt must be of such hardness that it does not damage the surface of the substrate, but will nevertheless remove the organic deposit layers. Preferably the hardness is not greater than 5 on Moh's.

[00031] The inventor also found out that a superior cleaning could be achieved in a very short period of time (about 20 seconds), without scrubbing, due to the interaction of the combination of the alcohol and the presence of the salt in crystal form. When the article to be cleaned is shaken, the crystal of the salt imparts a mechanical cleaning effect and supplements the chemical effects of the alcohol, and at the same time, the alcohol disinfects the surface being treated.

[00032] This represents a significant improvement over the prior art cleansing solutions, which required a minimum of one-half hour to soak, required scrubbing, and which are often not designed to disinfect. Further, in accordance with the present invention, it is only necessary to expose the internal surfaces (hard to reach surfaces) of the substrate to the cleansing composition and shake the article to be cleaned. This represents a significant savings over cleansing compositions that instruct the user to immerse the entire substrate in the cleansing solution.

[00033] The prior art cleansing solutions are thus not only comparatively ineffective in cleaning and sanitization ability, but they are annoying to use, and further require large quantities in order to immerse the device being cleaned, and thus are associated with significant cost.

[00034] The cleaning composition of the present invention in its basic form comprises:

- a) a water miscible solvent;
- b) an inorganic salt; and
- c) water;

wherein from about 30 to about 70% weight of the total composition is comprised of the inorganic salt in crystalline form.

[00035] The liquid portion of the composition comprises from about 30 to about 70 % of the total composition and the crystal form comprises from about 30% to 70% of the total composition.

[00036] The water miscible solvent: water ratio in the final composition is preferably in the range of from 9:1 to 2:1, preferably 8:1 to 5:1.

[00037] In a second preferred embodiment the cleaning composition for removing organic deposit comprises:

- a) a water miscible solvent;
- b) an inorganic salt;
- c) water;
- d) a terpene;
- e) an anti-bacterial agent; and

f) at least one surfactant selected from the group consisting of anionic surfactant, non-ionic surfactant, amphoteric surfactant and mixtures thereof;

wherein from about 30 to about 70% weight of the total composition is comprised of the inorganic salt in crystalline form.

[00038] The present inventor also discovered that the defects of prior art liquid cleaning composition can be minimized or overcome through the incorporation therein of a specified level of a terpene material in combination with a polar solvent of specified water-solubility characteristics.

[00039] Although the terpenes, as a class, have limited water-solubility, it has now been found that they can be incorporated into liquid cleaning compositions in homogeneous form with the ability to provide excellent cleaning characteristics across the range of water hardness or grease/oily soils and inorganic particulate soils, as well as on shoe polish, marker ink, bath tub soil, etc, and excellent shine performance with low soil re-deposition and little or no propensity to cause filming, streaking, or spotting on surfaces washed therewith.

water;

wherein from about 30 to about 70% weight of the total composition is comprised of the inorganic salt in crystalline form.

[00052] The liquid portion of the composition comprises from about 30 to about 70% of the total composition, and the crystal form comprises from about 30% to 70% of the total composition.

[00053] This unique combination of ingredients possesses unexpectedly superior organic residue removal and sterilization properties as compared to properties possessed by the several ingredients individually.

[00054] Surprisingly, superior cleaning can be achieved in a very short period of time (20-60 seconds) due to the combination of the alcohol and the presence of brine in crystal form. The crystalline salt imparts a mechanical cleaning effect and supplements the chemical effects of the alcohol and brine. The combination of the alcohol and crystalline salt produces an unexpectedly rapid and superior de-scaling and disinfecting of the internal surfaces of a substrate, and can produce excellent results in as little as 20-60 seconds without brushing. This represents a significant improvement over the prior art cleansing solutions, which required a minimum of one-half hour of soaking, followed by scrubbing, and which are not designed to disinfect.

[00055] Further, in accordance with the present invention, it is only necessary to expose the internal surfaces of the substrate to the cleansing composition. This represents a significant savings over cleansing compositions that instruct the user to immerse the entire substrate in the cleansing solution.

[00056] The proportion of water that may be present in the final composition and be within the scope of the invention can be functionally determined. If insufficient water is present, there is an insufficient formation of brine, and the effectiveness of the cleansing composition is reduced. As the proportion of water is increased, the water content will eventually reach a point at which the solubility for salt is too great, excessive amounts of salt

00057
00058
00059
00060
00061

will dissolve, and crystals will not be present in the cleansing composition. Accordingly, the water miscible solvent: water ratio in the final composition is preferably in the range of from 9:1 to 2:1, preferably 8:1 to 5:1.

Salt (Abrasive)

[00057] The salt must have high solubility in water, and a low solubility in water miscible solvent in order to provide the abrasion effect and be easily rinseable with water.

[00058] Due to the high solubility of salt in water (and poor solubility in water miscible solvent), as the proportion of alcohol is increased, the lower the amount of salt needed to ensure presence of crystalline salt in the final composition. As the proportion of water is increased (and the proportion of alcohol is correspondingly decreased), the proportion of salt must also be increased in order to ensure the presence of inorganic salt in crystalline form in the final composition.

[00059] Due to the presence of undissolved salts in the composition of the present invention, the composition is referred to as a composition and not as a solution.

[00060] The crystal of the salt, which acts as an abrasive, aids in breaking up the mass of organic deposit much more rapidly than a composition without an abrasive.

[00061] The water-soluble salt is preferably an inorganic salt, normally possessing not more than a single hydrated species when present as a crystalline solid in water at a temperature of from 10 to 40°C. in an amount in excess of that required to form a saturated solution. Exemplary inorganic salts, which can be used in the present invention, have the following physical-chemical characteristics:

Sodium Chloride	NaCl	mwt. 58.4428	sp.gr. 2.165
Sodium Bromide	NaBr	mwt. 102.90	sp.gr. 3.203
Magnesium Bromide	MgBr ₂	mwt. 184.13	sp.gr. 3.72
Magnesium Chloride	MgCl ₂	mwt. 95.22	sp.gr. 2.316

Potassium Chloride	KCL	mwt. 74.54	sp.gr. 1.984
Potassium Bromide	KBr ₂	mwt. 119.01	sp.gr. 2.75
Zinc Chloride	ZnCl ₂	mwt. 136.30	sp.gr. 2.91

[00062] Preferably, the water-soluble salt will have a Mohs hardness of at least 2 and less than 5.

[00063] The salt will also have solubility in water of at least 5 g/l at 10 °C., to ensure that any surplus salt can readily be rinsed from a hard surface after cleaning with the composition. In this way, the surface can be free from residual spots or streaks.

[00064] Preferably, the present invention uses sodium chloride. The advantages of employing sodium chloride are that:

- a) it is cheap and readily available;
- b) it is non-toxic and does not harm the surface;
- c) its solubility in water does not vary much over the normal product storage temperature, ensures that an excess of it will remain undissolved in the cleaning composition to provide abrasive properties, whereas it is sufficiently soluble in water to dissolve, when finally rinsed with water, a hard surface that has been cleaned with the cleaning composition;
- d) the crystalline form is sufficiently hard to exhibit good cleaning qualities, but it is less likely to scratch a hard surface to the degree that can occur when using other abrasive ingredients; and

e) sodium chloride is an advantageous abrasion material in cleaning compositions because it is not characterized by sharp rigid edges, and therefore will not produce micro-cuts on the surface of the substrate during use, as can occur with other salts.

[00065] The solubility of sodium chloride in ethyl alcohol at room temperature (25°C) is only 0.065 g/100g alcohol. The solubility in methyl alcohol is 1.4 g/100g alcohol.

[00066] The total amount of the inorganic salt in crystalline form present in the cleaning composition should be from 30 to 70%,

preferably from 40 to 53%, and ideally about 49% of the total weight of the composition.

Water Miscible Solvent

[00067] The water-miscible solvent useful in the present invention can be selected from aliphatic alcohols, glycol ethers, and mixtures thereof. Examples of alcohols useful in the present invention are the lower C₁ -C₈ mono-, di-, and tri-alcohols, such as ethanol, propanol, isopropanol, and propane-1,3-diol. Suitable glycol ethers are the alkylene and dialkylene glycol mono-C_{sub.1} - C_{sub.4} alkyl ethers where the alkylene group is preferably ethylene or propylene and the dialkylene group is preferably diethylene or dipropylene. Most preferably, a lower carbon alcohol is used.

[00068] Exemplary lower carbon alcohols, which can be used in the present invention, have the following physical-chemical characteristics:

Ethanol	CH ₃ CH ₂ OH	mwt. 46.0
Methanol	CH ₃ OH	mwt. 32.03
Isopropanol	CH ₃ CHOHCH ₃	mwt. 60.09

[00069] The cleansing composition preferably comprises from about 15 to about 50%; preferably from about 20 to about 40% of the total weight of the composition.

[00070] The present invention in another form has an organic solvent comprising from 20 to about 30 wt.% of the total composition, an inorganic salt comprising from 20 to about 49 wt.% of the composition, octoxynol-9 comprising from about 0.5 to 3 wt.% of the composition, a fragrance comprising from about .01 to 2 wt.% of the composition, a dye comprising from about 0.01 to 2 wt.% of the composition, and distilled water comprising from about 40 to 70 wt.% of the composition.

Other Ingredients

[00071] Fragrance and color are inert with respect to cleaning formulation, and are added to the composition to create a recognizable appearance and smell, and to make the composition more appealing to the consuming public.

[00072] For example, FD & C Yellow No. 5 is a yellow dye and FD & C Blue No. 1 is a blue dye with both dyes certified to comply with specifications published in the U.S. Code of Federal Regulations for Food, Drug and Cosmetic Colors.

[00073] In the second preferred embodiment, the present invention comprises a cleaning composition for removing organic deposit comprising:

- a) a water miscible solvent;
- b) an inorganic salt;
- c) water;
- d) a terpene;
- e) an anti-bacterial agent; and
- f) at least one surfactant selected from the group consisting of anionic surfactant, non-ionic surfactant, amphoteric surfactant and mixtures thereof;

wherein from about 30 to about 70% weight of the total composition is comprised of the inorganic salt in crystalline form.

[00074] This composition will be sold as a concentrate formula, which will be diluted by the consumer.

[00075] As compared with the basic embodiment, the second embodiment includes the addition of a terpene, an increase in the amount of octoxynol-9, which, as explained in the summary section, adds great cleaning power to the formulation. The amount of water miscible solvent was lowered because the combination of the terpene, octoxynol-9 and water miscible solvent will provide the same results even if the amount of the water miscible solvent has been lowered.

Terpenes

[00076] Preferred terpenes are mono- and bicyclic monoterpenes, especially those of the hydrocarbon class, which include the terpinenes, terpinolenes, limonenes and pinenes, and mixtures thereof. Highly preferred materials of this type are d-limonene, dipentene, alpha-pinene, beta-pinene and the mixture of terpene hydrocarbons obtained from the essence of oranges (e.g. cold-pressed orange terpenes and orange terpene oil phase ex fruit juice).

[00077] Citrus terpenes, including orange terpenes and d-limonene, are safe, effective, and naturally occurring organic solvents currently used as a fragrance additive in various soap products and perfumes, and as well as a flavor additive in foodstuffs and beverages. Because, for example, d-limonene is an effective organic solvent, it is also utilized in household and industrial cleaning products and is a viable alternative to potentially dangerous chlorinated hydrocarbon solvents.

[00078] D-limonene is a naturally occurring biodegradable solvent found in the oil of citrus peels of limes, lemons, and oranges to mention just a few sources. D-limonene provides good solvent power and has a Kauri-Butanol (K-B) value of about 62.7, which is indicative of its high solvent strength. Odorless mineral spirits by comparison have a K-B value of about 26. Since d-limonene is a safe and effective organic solvent, it is currently utilized in household and industrial cleaning products.

[00079] D-limonene is a member of the chemical class known as dipentenenes. Dipentenenes, other than d-limonene, which also exhibit exceptional solvent power, are derived from pine trees. The dipentenenes in turn are part of a more general class of chemicals called citrus terpenes, which as a group is characterized by strong solvent power. Some cuts of orange oil are sold as "orange terpenes" and function in an identical manner to the d-limonene organic solvent used in many of the representative examples disclosed below. Citrus terpenes are also part of the terpene

family which are used in the present invention. Therefore, those skilled in the art will readily understand that terpenes other than d-limonene may be used as the organic solvent in the cleansing composition of the present invention.

[00080] D-limonene dissolves hydrocarbon-based soils. However, while 100% d-limonene or a d-limonene/water mixture will slowly dissolve many organic deposits, the deposit will simply move around on the surface and not readily rinse off. Therefore, a viable cleaning composition having d-limonene or other terpenes preferably includes a surfactant.

[00081] The quantity of the terpene is in the range from about 2.5% to about 20% by weight based on the total weight of the composition.

Antibacterial agent

[00082] The antibacterial agent is present in the formulation in quantities effective to inhibit the growth and/or kill bacteria on the surface. Although various known antibacterial agents can be employed, such as chloroxylenol and the halogenated carbanilides, the antibacterial agents employed in the present invention are generally halo-substituted dihydric phenol compounds and most preferably, a dihydric phenol 2,4,4'-trichloro-2'-hydroxydiphenyl ether (triclosan).

[00083] The antibacterial agent is present in the formulation in an amount of from about 0.01 % to about 3.0% by weight based on the total composition.

[00084] Triclosan has a broad-spectrum activity against a variety of microorganisms. However, triclosan has very poor solubility in water and generally requires formulation additives to solubilize it. To solubilize triclosan, it is conventional to use a surfactant.

Surfactants

[00085] The surfactant system in the formulation of the present invention comprises a synergistic mixture of two or more

004463-03450

nonionic surfactants include ethoxylated alkylphenols, ethoxylated and propoxylated fatty alcohols, polyethylene glycol ethers of methyl glucose, polyethylene glycol ethers of sorbitol, ethylene oxide-propylene oxide block copolymers, ethoxylated esters of fatty (C.sub.8 -C.sub.18) acids, condensation products of ethylene oxide with long chain amines or amides, and mixtures thereof.

Preservatives

[00093] In order to prevent degradation and to extend the shelf life of the cleansing formulations, preservatives are included in the composition to prevent deterioration due to potential microbial contamination or decomposition through oxidation with air. Examples of antimicrobial preservatives, which may be used in the formulations, include methylparaben, propylparaben, diazolidinyl urea (Trade-name Germall II, Sutton Chemical), and polymethoxy bicyclic oxazolidine (Trade-name Nuosept C, Huls America). For example, a commercial preservative blend, which may be used in the present invention, is sold under the tradename Germaben II by Sutton Chemical and is a solution of diazolidinyl urea, methylparaben and propylparaben in propylene glycol.

[00094] Alternative anti-microbial preservatives which may be used include other derivatives of para-hydroxybenzoic acid such as a blend of Isopropylparaben and isobutylparaben and butylparaben; 2-bromo-2-nitropropane-1,3-diol; methyldibromo glutaronitrile and phenoxyethanol. Other anti-microbial preservatives include formaldehyde, imadazolidinyl urea, quaternium-15, phenoxyethanol, chloroxylenol, DMDM Hydantoin, and a blend of methylchloroisothiazolinone and methylisothiazolinone.

[00095] Anionic and cationic surfactants are generally the primary surfactant in cleansing compositions to give foaming and detergency. The cleaning compositions disclosed herein are unique because they use nonionic surfactants as the primary surfactant system in which the brine is stable. The loss of foaming is advantageous because it enhances the scrubbing effect of the brine. However, the loss of detergency due to the lack of anionic or

cationic surfactants is compensated for by the use of the terpene, which enhances the detergency of the nonionic surfactants.

[00096] In the third preferred embodiment, the present inventor felt the necessity to provide a cleaning composition that was just as fast and effective as his previous compositions, but with less alcohol and more natural ingredients in order to satisfy costumers with allergy problems or customers that prefer natural ingredients.

[00097] In this embodiment, the alcohol was replaced by an alcohol derived from natural resources such as SD 40 alcohol, and a terpene from natural source was used, such as D-limonene.

[00098] The present invention will be better understood from the examples, which follow. The below examples are illustrative of the preferred organic solvent and inorganic salt, and are intended to be illustrative only and not meant to unduly limit the scope of the invention. Unless otherwise indicated, percentages are on a percentage of composition basis.

[00099] It is essential that all the compositions of the present invention provide a sufficient amount of a salt in crystalline form, as an abrasive agent, which provide improved cleaning characteristics, specially in the hard to reach surfaces, with little tendency to cause filming or streaking on washed surfaces. Importantly, the abrasives used herein are non-detrimental to surfaces cleansed with the present compositions.

Example I

[000100] A cleaning composition was prepared having the following formulation.

Component	wt. %
Isopropyl Alcohol	47
Sodium Chloride (crystal)	37
Deionized water	13
Fragrance	1.5
Dye	<u>1.5</u>
Total	100

[000101] The composition was prepared by combining the organic solvent, the water, the fragrance, and dye with stirring until well blended. Then the finely divided salt crystals were slowly added, and again stirred to allow a small amount of the salt to dissolve into the solution. After preparation, the composition remained stable.

[000102] The composition was shaken, then poured into the interior surface of a substrate, and the substrate was vigorously agitated for about one minute. Shaking the composition allowed the organic salt to be evenly disbursed within the solution. The organic residue and scale deposited along the interior of the substrate was removed without damage to the substrate.

Example II

[000103] A cleaning composition was prepared having the following formulation.

Component	%wt.
Isopropyl Alcohol	36.0
Sodium Chloride (cystal)	49.45
Deionized water	8.75
d-limonene	3.9
orange oil	0.5
Octoxynol-9	1.4
Total	100

[000104] The composition was prepared by combining the solvent, the water, the d-limonene, octoxynol, and orange oil with stirring until well blended. Then finely divided salt crystals were slowly added, and the mixture was again stirred to allow a small amount of the salt to dissolve into the solution. After preparation, the composition remained stable.

[000105] The composition was shaken, then poured into the interior surface of a substrate, and the substrate was vigorously agitated for about one minute. The organic deposit along the interior of

the substrate was removed without damage to the substrate during each test.

Example III

[000106] A cleaning composition was prepared having the following formulation.

Component	%wt.
Deionized Water	23.8
SD 40 Alcohol	14.5
D-limonene	7.5
Nonoxynol 9	2.0
Nonionic Surfactant	1.5
Germaben 2	0.4
Blue # 1	0.000088
Yellow # 5	0.00121
Triclosan	0.25
Sodium Chloride	50.0
Total	100

[000107] The composition was prepared by combining the solvent, water, d-limonene, nonoxynol, nonionic surfactant, Germaben and dyes and antibacterial agent with stirring until well blended. Then finely divided salt crystals were slowly added, and the mixture was again stirred to allow a small amount of the salt to dissolve into the solution. It was noted that the increased amount of water caused a greater amount of salt to dissolve, but high amount of salt remained in crystalline form. After preparation, the composition remained stable.

[000108] The composition was shaken, then poured into the interior surface of a substrate, and the substrate was vigorously agitated for about one minute. The organic deposit along the interior of the substrate was removed without damage to the substrate during each test.

[000109] The cleaning compositions of the present invention thus facilitates the quick, efficient, and simple cleaning of hard to

reach surfaces without a brush - eliminating the conventional time-consuming process which consists of soaking for at least one half hour, followed by scrubbing with a brush which does not result in sterilization of the device.

[000110] The inventive compositions are simply poured into the interior of the substrate, and the composition is agitated within the substrate for about one minute. The action of agitating the composition within the substrate allows the composition to have complete contact with the entire interior surface of the substrate.

The crystal form of the inorganic salt acts as an abrasive and scours the interior walls of the substrate. The action of the inorganic salt against the interior surface of the substrate facilitates the removal of the accumulated scale and organic residue, which is softened by the solvent. Further, the cleaning composition disinfects any potentially harmful germs and bacteria within the substrate.

[000111] After cleaning the substrate, the composition may be disposed of by pouring down a sink. The material is easily washed down the drain because the composition is highly soluble in water.

[000112] As to the manner of usage and operation of the present invention, the same should be apparent from the above description. Accordingly, no further discussion relating to the manner of usage and operation will be provided.

[000113] With respect to the above description then, it is to be realized that the optimum proportional relationships for the ingredients of the composition, to include variation amounts of components by weight of the entire composition and manner of intermixing are deemed readily apparent and obvious to one skilled in the art, and all equivalent relationships to those described in the specification are intended to be encompassed by the present invention.

[000114] Therefore, the foregoing is considered as illustrative only of the principles of the invention. Further, since numerous modifications and changes will readily occur to those skilled in

the art, it is not desired to limit the invention to the exact construction and operation shown and described, and accordingly, all suitable modifications and equivalents may be resorted to, falling within the scope of the invention.
